To the Lake Forest College Community:

It is my pleasure to welcome you to the 2010 Spring Student Symposium, one of the highlights of our academic year, featuring a host of scholarly presentations, artistic performances and exhibits from students across campus.

This year's broadly varied presentations will include, among many others, an examination of Edward H. Bennett's original vision for Chicago's Grant Park, a study linking chronic stress and the development of depression and anxiety disorders, a review of research findings on pathologies in Parkinson's Disease, an exploration of questions of Mexican identity and the Spanish language of first- and second-generation Mexicans, a correlation study on drug abuse during adolescence and increased risk for addiction, and a study of Plato's Meno dialogue and its consideration of the question whether virtue can be defined and taught.

These and many other fascinating presentations and discussions will fill the 2010 Symposium and clearly demonstrate the breadth and depth of our intellectual community. I look forward to seeing you in the audience.

Sincerely,

Stephen D. Schutt
President
A little more than a decade ago, Dean of Faculty, Provost, and Professor of Mathematics Steven P. Galovich proposed an idea that would highlight his passion for the academic work of students. He believed that Lake Forest College should devote a day during the academic year to showcase students and their research. He was so committed to the idea that he recommended the cancellation of classes so students could freely attend and participate in all the events.

The First Annual Student Symposium was held April 7, 1998. Nearly 1,000 members of the College community attended 118 student presentations, poster sessions, music concerts, and other events throughout the day and evening. Never one to stay in his office, a beaming Dean Galovich made a point to go to as many sessions as possible.

Ten years later the Student Symposium — which has since stretched to two days to accommodate growing interest and participation — is stronger than ever. This year, more than 350 students and campus groups will present, perform, demonstrate, and share their scholarship with the College community.

While he would have never taken credit for the idea, Steven Galovich’s mark on this event is undeniable. When he died unexpectedly, Lake Forest College decided to honor his legacy by renaming an occasion that has become an integral part of the College.

We dedicate the annual Steven Galovich Memorial Student Symposium for his contributions to academic discourse and his commitment to celebrating student research.

The Brain Structure Striatum Mediates Motor-Skill Learning in a Running Wheel Paradigm in Rats

This study investigated mechanisms of motor-skill learning in the brain structure basal ganglia in rats. We examined whether a long-term motor skill can be acquired with relatively short training and whether the striatum (a nucleus of the basal ganglia) is involved in this learning. First, we found that rats learned this new motor skill in two training sessions. Next, we found that motor-skill learning was inhibited by the infusion of a specific peptide (designed to inhibit glutamate receptors) into the striatum. These findings suggest that acquiring this particular motor skill is possible, even with short learning opportunities. Learning inhibition by drug infusions demonstrate that the striatum is critical for the consolidation of motor-skill memory.

Khataman-nabiyeen: Muhammad as Seal of the Prophets

This paper presents the Islamic conception of prophet-hood and explains why Muhammad is given a higher status than other prophets while at the same time presenting Islam’s understanding of the prophets before Muhammad. It explains what is meant by Seal of the prophets and why it is of importance. It introduces Islam’s understanding of prophet-hood in general and ties it into Islam’s belief in religious evolution, which touches on Islam’s beliefs about Moses and Jesus. It also discusses Islam’s understanding of itself as the pinnacle of religious evolution and how this leads to Muhammad’s status as the Seal of the Prophets.

Edward H. Bennett and Grant Park: An Extended History

After spending the beginning of his career looking down at Grant Park from his office in the Railroad Exchange, Edward H. Bennett re-designed the space though not along the lines of the 1909 Plan of Chicago. Through a number of letters and Bennett’s own sketches we are able to fully grasp Bennett’s vision for the park and his reactionary, early renaissance stylistic preference. By comparing Bennett’s notes and plans for the 1915 Panama Pacific International Exhibition with the final plans for the Park it becomes evident that Bennett was not simply adapting Daniel Burnham’s plan for Grant Park, but instead continued a style Bennett had been perfecting for years.

Effects of Stress on Emotion-related Behavior in Rodents: Implications for Affective Disorders

Chronic stress can enhance the development of psychopathologies such as depression and anxiety disorders. Understanding the factors that contribute during the development of these effects of stress may help produce new treatments for stress-related disorders. Effects of stress can be examined in rodent models of emotion, such as anxiety-like behavior in the elevated plus maze, and fear behavior in Pavlovian conditioning. Male and female Sprague-Dawley rats were used to explore these behaviors in response to restraint stress.

Moderation and Sexuality

When placed in a particular paradigm of civilization the subject of sex (and as an extension, erotics) can take on differing but no less substantial significance. Michel Foucault’s rendering of sexuality from an ancient Greek perspective removes the subject from the classical Christian paradigm of repression and redefines it completely. This paper focuses on the ideas derived by Foucault examining the emphasis placed by Greek culture on moderation and the means of achieving it by delving into the internal struggles of man in attempting to exercise self-control.

Strategic Enticement Theory: Polish-American Security Relations

Since the fall of Communism Poland’s transatlantic foreign policy has focused almost exclusively on wooing the United States into a strategic partnership. Poland’s strategy of enticing the United States has at times compelled it to act as a vessel for America’s interests even on matters unrelated to its immediate security needs. Though Poland has gotten little in return for its loyalty to the United States, it is nonetheless determined to entice the United States into a strategic alliance. I use this bilateral relationship to illustrate my strategic enticement theory of how middle powers maneuver politically to draw big powers into alliances with them.

Mexican Identity in Chicago

This senior thesis will explore questions of Mexican identity as well as the Spanish language of first- and second-generation Mexicans in the Pilsen area, specifically within a social as well as linguistic context. I examine these concepts through a series of questions on self-identification, gentrification, assimilation as well as influences by English or Spanglish. I am interested in how they have assimilated to life in Chicago and which aspects of their Mexican heritage they continue to maintain. Finally, I also explore how recently NAFTA has pushed migration to the U.S giving Mexicans a presence in the social sphere.

Skinning the Canvas: A Reconstruction of the Female Body

My presentation addresses a central question posed by artist Carolee Schneemann: “How can I reestablish the female body, pull it off this dead canvas?” Schneemann's esoteric statement reflects the notion in evolution during the late twentieth century that painting implicitly favored the male body and was therefore an insufficient means of representing a female experience. I will investigate how the artists Eva Hesse, Carolee Schneemann, Ana Mendieta and Jenny Saville, all originally painters, worked toward a more visceral expression of the female form. Each artist incorporates metaphorical and material references to the flesh in order to reconstruct the female body in art as well as the viewer's relationship to it.

Society’s Hesitance to Accept Interracial Relationships

This presentation deals with why interracial relationships are still not entirely accepted in our society. This project investigates the extent to which the lack of acceptance is affected by ethnic culture, social environment, and whether a person is of an older or younger generation. I further question whether there will be a time when being in an interracial relationship will no longer be a foreign occurrence. This presentation will show that society's inability to accept interracial relationships is due in large part to the unconscious effects of cultural norms and concerns about the consequences of developing of new norms on the stability and respectability of one's own culture.

The Perils of Indifference: How Narratives, Personae, and Narratives Can Inspire an Audience

Elie Wiesel has inspired millions with his writings on the Holocaust. His ability to capture human suffering, emotion, and motivation is what makes his works more than just historical accounts of our dark past. In his speech “The Perils of Indifference: Lessons of a Violent Past,” Wiesel uses his experience in the Holocaust as merely a narrative and underlying metaphor to motivate today's population to take a stand on issues of suffering. In this paper, I demonstrate how Wiesel uses metaphors, persona, and narratives to inspire his multiple audiences to join him in the fight against human suffering.

Mackenzie Buchanan '10; Philosophy, Religion

Reason, Emotion, and Religious Experience

Phenomenology of religion claims that true knowledge of God is gained through religious experience. This experience is often defined as passive, transient, noetic, and ineffable. Moreover, the religious experience is believed to be emotional as opposed to rational. However, what if emotions are not distinct from the rational? In philosophy, the cognitive theory of emotion states that emotions are not passive and irrational forces that move us to act, but rather conceptual value-judgments. This presentation will show how this cognitive theory of emotion problematizes and contradicts the phenomenology of religion.

The Looming Transition - Time for “The Talk”

Graduating college represents a major transition in the lives of many Americans, and part of that transition is often deciding how - or whether - to move forward with a significant other. With this in mind, I interviewed a small sample of graduating Lake Forest College seniors who are involved in romantic relationships to try to uncover how students are considering their relationships in their plans for the future. I have evaluated my data with a theoretical basis that demonstrates both the importance of this particular life transition, and how the self affects, and is affected by the upcoming challenge. I have also examined the institutional pressures that might affect both how a student perceives the upcoming transition, and how this might affect his or her consideration of their current romantic relationship.

Cocaine Exposure and Withdrawal Changes Rat Frontal Brain Activity in an Age-dependent Manner

Exposure to a drug of abuse during adolescence significantly increases the risk for addiction, when compared to young adulthood. However, the mechanisms underlying this increased risk remains unclear. Here, in a rat addiction model, we asked whether the age at which cocaine is given and the period of withdrawal plays a role in determining changes observed within the brain reward system. We assessed cortical activity with cytochrome oxidase (CO-I) staining as an indicator of brain metabolism. In adolescent rats, significant CO-I increased in several frontal cortical regions that underwent a 3-week withdrawal, compared to a 3-day withdrawal from cocaine exposure.

But What Happens to These Kids?: Former Montessori Students Reflect on their Schooling
In American culture we have become accustomed to thinking about traditional schools as the best mode of education. However, there are many alternative schooling methods which challenge the supremacy of traditional structures. Among the most widespread of the alternative approaches is the Montessori Method. As Montessori schools have increased in number and expanded beyond preschool, researchers have begun to systematically assess the outcomes of Montessori education. This project focuses on a little studied outcome: the personal experiences and reflections of Montessori graduates.

The Lithuanian Rumspringa
This project studies the values and beliefs of Lithuanian-American Catholic college students regarding sexuality. These students often feel torn between two worlds when the conservative values instilled in them by their ethno-religious community are completely at odds with the college community surrounding them. Personal interviews and studies of similar transitional periods, such as the Amish Rumspringa, revealed interesting patterns and explanations for particular values and beliefs of this community. This ultimately led me to observe how these students are able to find a healthy balance between opposing worlds.

Studying to be a global citizen
Lake Forest College’s mission statement affirms, in part, that we “prepare [students] to become responsible citizens of the global community.” I spent last year (2008-2009) studying in Valparaiso, Chile and striving to live out this goal. In various ways I successfully immersed myself in Chilean culture: living with a host family, attending the local university, and completing a volunteer internship. Yet in a place with different standards, values, and ways of operating, it is not easy to always be that “responsible citizen of the global community.” In this presentation I will recount stories, challenges, and lessons learned while abroad.

Four Parkinson’s Disease Stories: E46K, Phosphorylation, Alanine-76, & Domains
Parkinson’s diseases (PD) is a fatal neurodegenerative disorder linked to the misfolding, accumulation, and lipid-association of the alpha-synuclein protein. However, exactly how alpha-synuclein causes pathology is unknown. Our lab utilizes a budding yeast and fission yeast model to study alpha-synuclein. My poster details four areas of Parkinson’s research that comprised my senior thesis in biology. First, I gained insight into how recently discovered familial mutation E46K imparts toxicity. I also found evidence for the role of phosphorylation on alpha-synuclein’s pathotoxicity. Next, I determined the pathological contributions of alpha-synuclein’s 76th amino acid. Finally, I determined that alpha-synuclein’s three domains differentially contribute to the protein’s pathotoxic properties.

Michael Fiske ’10; Biology
Insight Into Parkinson’s: Does the E46K Familial Mutation Doom Yeast?
Parkinson’s disease is a devastating and incurable neurodegenerative disorder afflicting over one million Americans. The death of a specific population of neurons in the brain due to accumulated alpha-synuclein protein causes the disease. While a majority of PD cases occur sporadically, a smaller portion result from specific genetic mutations in the alpha-synuclein gene. I studied the recently discovered E46K alpha-synuclein mutant in a budding and fission yeast model. I found that E46K localized to the plasma membrane in budding yeast, aggregated in fission yeast and enhanced toxicity in one fission yeast strain. These E46K properties provide insight how it causes PD.

One for all: Expanding the Horizons of Our PCR Assay to Measure Telomere Length of a Variety of Organisms
Telomeres, the non-coding DNA sequences that protect eukaryotic chromosomes, are key in studies regarding aging and cancer. Our molecular biology laboratory is particularly interested in studying telomere length and its relation to aging. To study telomere length, we use the versatile fungus Aspergillus nidulans, as a model organism. Recently, our laboratory developed a novel PCR assay for measuring telomere length in A. nidulans. Consequently, we believe that it would be a good contribution to science if the capabilities of the novel PCR assay could be used in other organisms having different telomere sequences. Therefore, our aim in this project is to reproduce the results obtained with A. nidulans in the organism Aspergillus oryzae.

A Nation Alive in the Diaspora: Statelessness and the Transnational Experience for Palestinian Immigrants from 1967 to the Present  
Palestinian Americans of the post-1967 cohort have had an atypical immigrant experience. For one thing, keeping their ethnic identity alive is extremely important to them in light of Palestinian-Israeli conflicts. For another, they are residing in a country that heavily supports their oppressor, where wanting a free Palestinian state is sometimes mistaken as anti-Semitic propaganda. Maintaining Palestinian culture includes raising awareness about their statelessness issue, along with speaking Arabic, cooking ethnic food, and similar practices most groups follow. Since daughters are symbols of Palestinian culture, the pressure to preserve national identity is more heavily placed on Palestinian women.

Shakespeare’s Richard III in Historical Context  
Being political or politically outspoken in Tudor England left one vulnerable to the accusations of treason. Shakespeare was aware of this and wrote with great care not to offend the Queen. Shakespeare’s composition of Richard III as an evil and deformed miscreant suggests that his play promoted the Tudors’ interpretation of history; when it actually questions it. While Richard III is not a blatant contradiction of the Tudor Myth, it subtly challenges each tenet that constructs that myth.

Natives of Peru and Bolivia: A Comparison of the Political Mobilization of Indigenous Groups

This paper compares the political mobilization of indigenous groups in Peru and Bolivia. Although both of these Andean countries have large indigenous populations, they are at opposite poles when it comes to their native populations’ participation in politics. Whereas the natives of Bolivia have organized themselves in an unprecedented fashion, there continues to be a lack of political mobilization of indigenous groups in Peru. I discuss some of the socio-political reasons that might explain the differing levels of political mobilization of native groups in these two neighboring countries.

The Search for Telomerase RNA in Aspergillus oryzae

Telomeres are found at the end of chromosomes and are vital for chromosome replication. An enzyme, telomerase, adds telomeric DNA to the telomere. If the telomerase gene is incorrectly expressed, it adds DNA repeats which could cause cancer. We are interested in the telomerase RNA of Aspergillus oryzae, which carries the template for synthesizing telomeric repeats. The gene encoding the telomerase RNA has not been identified in any filamentous fungus. The only sequence known is the template for the telomeric repeats. Using Reverse Transcriptase-Polymerase Chain Reaction, a folding program and comparison of structure, we hope to determine the telomerase RNA in Aspergillus oryzae and contribute to cancer research.

Analyzing Splicing Differences in Genes Associated with Alzheimer's Disease

Alzheimer's disease (AD) is a debilitating neurodegenerative disorder in which there is a need to identify molecular biomarkers for earlier diagnosis. We hypothesized that changes in splicing of genes associated with AD may provide biological markers of AD. We examined this in post-mortem samples from normal, AD, or mild cognitive impairment (MCI) brains using RT-PCR. Overall, there were alternative splicing differences in the mid-temporal brain region, with control patients exhibiting more APOE2 exon 19 inclusion than other conditions. Thus, our preliminary studies suggest molecular markers can provide early detection of AD.

The Effect of Prior Experience of Male Color Morph Frequency on Sexual Responsiveness of Female Guppies

Female guppies choose their mates based on amount of orange coloration and frequency of color morphs. Previous studies have shown that female guppies show increased responsiveness to males with color patterns that are rare, unique or unfamiliar. My study seeks to determine if a female's previous experience with a male's color pattern as rare or common affects her sexual responsiveness to him in a subsequent one-on-one encounter. This would suggest that females are able to calculate and remember color morph frequencies within a social group. Alternatively, my data could show that orange coloration is a more important factor than morph frequency.

Faraday Rotation - Light Taking a Spin in Glass

Polarization is a property of light employed in good sunglasses. When light travels through glass, the direction of polarization can be rotated by a magnetic field. This phenomenon was first observed by Michael Faraday in 1845. I built an apparatus that will be used for a Faraday rotation experiment in the laboratory portion of the optics course. The study involves measuring how much the polarization of laser light rotates as the magnetic field changes. Different colors of light are spun by different amounts. This effect is small, but it can be used to transmit information, such as my voice, over a laser beam.

Comunidades de base and Liberation Theology in Brazil

During the 1950s and 1960s, the majority of Latin Americans who were under social, economic and political oppression could not make sense of the Catholic Church's message. Liberation theology, and its commitment to social justice, emerged as a discourse to which Latin Americans could finally relate. The establishment of comunidades de base in Brazil prior to the Council of Vatican II in 1962, shows that liberation theology materialized, in great part, as a result of the ideas being explored by individuals within these communities. Liberation theology, therefore, as adopted by the hierarchy of Church and particularly in Brazil, allowed for CEBs to be conceived as safe spaces, places where people could meet to discuss political issues as well as organize for political actions.

Television Comedy, Post-Sitcom

For most of the history of television, televised comedy has been dominated by one comedy genre: the situation comedy. For the past few decades, this televisial format has come under fire for being antiquated and formulaic, lacking the capacity to perform effectively as a vehicle for social commentary. However, recent years have seen a renaissance in American televisial comedy with the rise of shows like Arrested Development, Curb Your Enthusiasm, Parks and Recreation, and, perhaps most notably, The Office. This presentation explores The Office: Season One as a paradigm case for a new televisial genre that Brett Mills calls comedy verité. Furthermore, this presentation discusses how the comedy verité genre is preferable to the traditional sitcom because of its tendency to allow the televisial reader to interrogate and challenge the ideological framework that the traditional sitcom format so effectively masks.

In the Language of Women

In her book A Room of One's Own, Virginia Woolf explores the question of whether women would, in her society, be able to gain respect as writers in the same way as male writers. There have been many feminists who, inspired by Woolf's work, have stressed the importance of rhetoric for women by women. However, as Michael Cunningham's novel The Hours demonstrates, women's rhetoric may come in many forms. This novel raises certain questions: Can a book written by a man be effective as women's rhetoric? Is the novel the most appropriate medium to carry this message? This presentation explores how the heteroglossia of the novel makes this literary form an ideal medium to carry the message of women's liberation through a discussion of The Hours in its novel and cinematic form.

The Effect of Female Labor Force Participation on Divorce: An Empirical Study Testing the Correlation between Women’s Employment Statuses, Household Income Contributions, and Divorce
The U.S. divorce rate experienced a sharp increase between 1960 and 1980, and a similar trend is observed in the female labor force participation rate. Observing this, economists began to probe the relationship between divorce and female labor force participation. The goal of my research is to analyze the extent to which female labor force participation impacts the probability of divorce. Various econometric procedures, including a linear probability model, corroborate prior research and suggest that a positive relationship exists. Moreover, empirical findings show a positive relationship between a wife’s contribution to total household income and the likelihood of divorce.

Justin Messmore ’10; Philosophy
Intersubjectivity and Love in the Thought of Sartre and Levinas
Intersubjectivity is the philosophical term for the relationship between two otherwise independent subjects, and one form of intersubjectivity is that which we call “love.” But what is love, and how do we do it? Is it even possible? My project undertakes a critical investigation of love in the thought of two influential philosophers: Jean-Paul Sartre and Emmanuel Levinas. Sartre is famous for his play in which a character exclaims, “Hell is—other people!” Levinas centers his philosophy of love on an infinite ethical responsibility for the other person’s well-being. I believe, however, that these philosophers are more similar than they appear.

Was Pilar Primo de Rivera a Feminist?
Pilar Primo de Rivera grew up in the family of history-making leaders. Her father General Miguel Primo de Rivera ruled Spain as a dictator from 1923-1930, and her brother founded the fascist-inspired Falange Española. At an early age, Pilar realized that she had inherited the quest for power and making history. Her desire to follow in her family’s footsteps, most of all her brother’s, positioned her at the top of the political spectrum. As the director of the Sección Femenina Pilar held enough political power to make important changes during the Franco regime (1939-1975). Pilar strove to make women realize their important role in the post Civil War community. Although she claimed to be fighting for women’s rights, it seems that she was fighting for traditional Spain at the expense of women. In this presentation I intend to address Pilar’s contribution to Spanish society while also showing the anti-feminist elements in her ideology.

Corruption in Europe: Causes and Consequences

This presentation addresses the issue of corruption on a national level. Some of the questions I explore include: Why are some countries more corrupt than others? Why are even the richest countries in the world plagued by malfeasance? What causes corruption and what can governments do to reduce it? Data from Transparency International and the World Bank is used in an empirical study of corruption in 35 European countries. Among the major findings is that the individual socio-economic characteristics of every state must be considered before an optimal strategy for moderating corruption can be found. On the highly institutionalized European continent, a fine-tailored model of corruption could be crucial in the fight to eliminate corruption.

The Fishbowl We Live In: An Analysis of the Culture Industry and Self-Commodification

What water is to a fish, culture is to a human; there is no way to live outside it for more than a brief moment. In a time of capitalism, culture is used as a powerful weapon to manipulate the masses. The culture industry uses media to teach people that they can commodify themselves in order to appear more desirable. After researching the culture industry, I concluded that the commodification of self is a learned idea which is strongly reinforced by the industry's use of self-help narratives, television, and advertising.

Subservience: A Relationship Between the Executive and Judiciary

This research paper critically analyzes the President's control over the Supreme Court's decisions and discusses just how the President's party affiliation influences the decisions of the Court. Federalist Alexander Hamilton warned that the executive branch is bestowed with the power of the sword; the legislative branch has control of the purse, yet the judicial branch only possesses the power to pass judgment and must rely on the other branches to enforce their decisions. I argue that the Solicitor General has evolved into a politicized office to serve the President, which was not its intention. It is in this context that I explore whether Hamilton's prognosis has come to fruition in our current political climate.

Pulsed Nuclear Magnetic Resonance

Nuclear Magnetic Resonance (NMR) is a ubiquitous imaging technique used to characterize materials ranging from chemical compounds to human bodies. Pulsed NMR, in particular, provides valuable information regarding the excitation behaviors of atomic nuclei. Our ultimate goal has been to investigate the effects of extremely short pulses on NMR signals. In doing this, however, we have been faced with the fact that theory predicts a very weak signal. In this our experiment we use a phenomenon called spin echo to help observe the signal.

Examination of Amine Blocking Groups in Specific Sonogashira Coupling Reactions

Carbon-carbon bond formation is at the forefront of organic synthesis. One important aspect of carbon-carbon bond formation is the use of various blocking groups. These groups assure that side products of coupling reactions are limited during synthesis and assure their specificity. The development of blocking groups is therefore a necessity for progress in carbon-carbon bond formation. This study focuses on specific examples of the Sonogashira coupling reactions using amine blocking groups. This is important due to the difficulty of carbon-carbon bond formation in the presence of nitrogen. Therefore, an in-depth study of various amine blocking groups will allow for easier carbon-carbon bond formation with nitrogen present.

EIT: Making Light “Invisible”

Electromagnetic induced transparency (EIT) is a phenomenon that I have been investigating as my senior thesis. By way of background, let me mention the well-known fact that certain colors of light are strongly absorbed by a gas of atoms. EIT is a strategy to prevent this absorption. For the rubidium atoms I am using, those special colors are in the infrared. A system exhibiting EIT shows useful properties, such as the ability to detect small magnetic fields and reduce the speed of pulses of light. My presentation will show how we are attempting to implement EIT in the laboratory.

An Empirical Study of Security-related Transparency in International Relations

I use annual data from the United Nations Register of Conventional Arms (UNROCA) to test various theoretical explanations of the phenomenon of international transparency in the security realm. Central to the study is the constructivist theory of transparency as an emerging norm in international relations. The goal of the project is to complement and improve on past research on the topic, particularly by focusing on case studies that do not comply with existing models.

**Combinatorial Game Theory and The Game of Rectangle**  
Combinatorial game theory, in contrast to classical game theory, considers conventional games and not economic situations or other “real life” forms of competition. Chess, Checkers, Connect 4, Jenga, and Mancala are just some games that can be analyzed using combinatorial game theory concepts. For my project, I researched the basic concepts of combinatorial game theory and how to solve simple games. I then designed a game of my own, Rectangle, and found ways of determining the winning strategy for certain cases.

**Insight into Parkinson’s Disease: Is α-Synuclein Degraded by Endocytosis?**  
Parkinson’s disease (PD) is an incurable fatal brain disorder linked to three disease-related properties that result from α-synuclein accumulation: its misfolding, aggregation, and cellular toxicity. Accelerating α-synuclein degradation might provide therapy by reducing its accumulation. We tested if the lysosome degrades α-synuclein by a specific route: endocytosis. Specifically, we evaluated if α-synuclein accumulation, aggregation, and toxicity worsened in yeast strains that eliminated specific genes that control endocytosis. In fact, most gene deletions tested so far altered one or more properties to different extents. Our data suggests that α-synuclein is degraded by the lysosome using the endocytosis route.

Ashleigh Porter '11; Biology  
**Possible New Cancer Treatments: Ribosome Biogenesis as an Unexplored Target**  
Cancer cells constantly need new proteins and therefore have high need for the protein making machines—ribosomes. Ribosome biogenesis is therefore an attractive target for cancer treatment. Duplex formation between the U3 RNA and precursor ribosomal RNA (pre-rRNA) is a key step in ribosome biogenesis. To achieve the necessary high U3-pre-rRNA duplex yield, two essential proteins (Imp3p and Imp5p) are needed to increase the stability of this duplex. We hypothesize that these proteins stabilize the U3-pre-rRNA duplex by hydrogen bonding to its 2’-hydroxyl groups. I am testing this hypothesis by determining how selective replacement of specific 2’-hydroxyl groups with hydrogen atoms affects duplex stability.

**Measuring Fungal Ends: Does Length Vary With Reproductive Mechanism?**  
At the ends of every chromosome lies a repeating DNA sequence that serves important biological functions and has unique characteristics. This repetitive DNA and its critical proteins, termed telomeres, are known to assist with cellular processes during sexual development. Some studies on mice show that telomere lengths are longer in sexual or meiotic cells than in other mitotic cells. Scientists hypothesize that the telomere lengths of meiotic cells are passed on and would affect the lifespan of future generations, unlike those in mitotic cells. We attempt to explore this question of telomere length variance in meiotic versus mitotic cells of a fungus, Aspergillus nidulans, using an assay called the Polymerase Chain Reaction.

**The Burden of Representation: The Afghan Girl**  
National Geographic has always been a magazine that has captivated the world with its images and stories that delve into the lives of other people and their cultures. It has become a magazine that aspires to bring global culture into the ordinary hands of American citizens. This presentation will focus on how the Afghan Girl photograph, that was made famous on the June 1985 cover of National Geographic, has become an iconic image and has in turn become a representation of Afghan women everywhere. This presentation will also argue that this image began to exemplify the oppression of women, and has in turn reinforced the inferior status and treatment of women in Afghanistan. Today, in the aftermath of 9/11, this image still continues to work as a piece of visual rhetoric to convey the “us” versus “them” mentality that has since created new tensions within our own society about the Afghan culture and its people.

Public housing may be known for providing the working class with gang infested, crumbling high-rise towers to call home, but it is actually an attempt to move people out of poverty. Over the years federal policy has tried to clear out the slums to be replaced with safe and sanitary living conditions. In 1992 the federal government launched the HOPE VI housing program. This mixed income model replaced high rise towers with smaller, more welcoming and visually appealing homes where a variety of income levels could share a community. But has this program provided any hope for those in poverty to rise above it?

How I Translated The Gift of Rain
A sine qua non condition for translating Tan Twan Eng's The Gift of Rain for the Romanian public was to make each word sound as if it was originally written by a Romanian writer. It meant the frantic, punctilious work of a cultural jeweler: the descriptions of post-war Malaysia or the dialogues between a Japanese spy and his Chinese student, though sometimes too exotic for a Romance language or for the Eastern European terminology, had to flow naturally as if the world spoke the same language and shared the same history. During the Student Symposium, I invite you to discover the secrets of a literary translation and the macroscopic challenges that lie behind a great story.

Synaptic Changes in the Prefrontal Cortex during Adolescence in Rats
Little is known about the mechanisms that support the maturation of dopamine action in the prefrontal cortex (PFC) of our brain during adolescence. Here, we investigated how NMDA receptor-mediated synaptic transmission changes during the peria losence period in rats. Across development, PFC NR2B levels (NR2B/NR2A ratio) were lower in preadolescent rats and increased, approaching adult levels during late adolescence. Subjacent cortical regions followed a different developmental trajectory. These results indicate that maturation of NMDA function in the PFC is region-specific. A relative augmentation of NR2B subunits underlying the enhanced NMDA-mediated synaptic transmission may account for maturation of dopamine action in the PFC observed during the adolescent transition period.

The Exploration of Early Cretaceous (90 Million Years Ago) Fossils in Central Utah
The long-term goal of this project is to determine how preserved biodiversity varies between fossil sites and how to reconstruct an ecosystem based on these inherent differences. In order to collect the necessary data, we traveled to central Utah and collected samples of sediment from the Early Cretaceous (90 Ma) and the Late Cretaceous (80-70 Ma). The Early Cretaceous project focused on three dinosaur sites excavated by the Field Museum containing two ornithopods (herbivorous, bipedal dinosaurs) and one new species of theropod (carnivorous dinosaur). A collection of microvertebrates encased in the same sediment as the dinosaurs and will provide an initial estimate of the types of organisms living with and buried with the dinosaurs. At these sites we also found small theropod teeth, teeth from 2-3 species of crocodiles, and skeletal remains from unidentified species. From this data, we can understand what dinosaurs and vertebrates existed during this time.

The Women of Beowulf: Queen Wealththeow and Grendel’s Mother as Sovereignty Figures and Counterparts
Beowulf is named after its male protagonist, and yet at the heart of the story are two powerful female characters: Wealththeow, queen of the Danes, and Grendel’s mother, mother of a monster. Not only in the ancient epic but also in modern reinterpretations, these two figures are counterparts. Each also serves as a sovereignty figure, granting the king/future king the authority to rule – either through her blessing or through her defeat. My presentation will examine the story of Beowulf and the characters of Wealththeow and Grendel’s mother as well as the evolution of their portrayal in popular culture.

A Method to Study the Subcellular Localization of Micro-RNAs Diagnostic of Breast Cancer

Micro-RNAs are post-transcriptional regulators. Recently, miRNAs have emerged as diagnostic markers of breast cancer. An emerging hypothesis is that miRNAs may be released from cancer cells through cargo within exosomes, which are vesicles produced in multivesicular bodies (MVBs). Using fluorescent in-situ hybridization, I tested if two micro-RNAs (hsa-miR-923 and hsa-miR-1246) co-localized within cells to CD63, a protein marker of MVBs. I found that although these miRNA specifically form clusters within cells, they co-localize with CD63 to a very limited extent. Our data suggest alternative pathways to MVB by which miRNAs are released from the cell.

A Comparison of Microfinance in Developing and Industrialized Economies
Microfinance has become a global phenomenon in creating ways to alleviate poverty, to increase entrepreneurial initiatives, to find pathways to women's empowerment and to contribute to programs in community development. Microfinance is traditionally used as a development strategy in developing nations, however in recent years companies, non-governmental agencies and financial institutions in industrialized nations have started to utilize microfinance as a means to reach thousands of “unbankable” citizens. This project searches to find ways in which the traditional strategies of microfinance can be employed to support effective and productive microfinance programs in industrialized nations, specifically in the United States. A major focus of this project is to examine how specific cultural, social, economic and political conditions affect and contribute to a microfinance program’s success for target markets, such as immigrant populations, in the United States.

Using Nematodes to Find Mutations And Modifier Genes
Caenorhabditis elegans are powerful model organisms to study human diseases because of their short life span and well understood genome. Duchene Muscular Dystrophy is one such disease. C. elegans expresses the homolog (dys-1) of dystrophin. DMD is progressive degeneration of skeletal muscles. The DMD causing mutation in dys-1 also leads to the loss of function in BK channels (slo-1 in worms). First, C. elegan strains were studied to determine the location of a mutation which alters the effects of the above mentioned mutation. Second, dys-1 worms were further mutated to identify modifier genes, which may alter the rate of DMD symptoms.

Extending Kitcher’s Account of Reduction to Other Special Sciences. A Consideration of Organic Chemistry and Quantum Mechanics

Phillip Kitcher’s essay, “1953 and All That: A Tale of Two Sciences,” shows that explanations of classical and molecular genetics are autonomous, and that one cannot be substituted for the other without losing accuracy. It can be shown that Kitcher’s anti-reductionist argument is true outside of biology. This presentation considers anti-reductionist examples from organic chemistry and quantum mechanics. It shows that autonomy of the two scientific explanations stems from their different objectives, purposes, and methods. This autonomy enhances the explanatory powers and applicability of the theories, and it does not have to compromise the commitment to realism about entities.

New Method for Sampling Hazardous Air Pollutants (HAPs) in Chicago Air using Solid-phase Microextraction and Gas Chromatography/Mass Spectrometry

Hazardous Air Pollutants (HAPs) are toxic chemicals, whose emissions are regulated by the EPA. Monitoring HAP concentrations is useful in tracing air pollution, but presents challenges related to sample contamination, equipment cost, and environmental hazards. In this study, polymer-coated fibers were used to selectively sample HAPs from Chicago air before laboratory analysis. This novel technique is simple and cost-effective, unlike more traditional approaches. Two different approaches to air sampling were used: extraction from stagnant air contained in sample bags and extraction from moving air. Sampling of moving air showed more promise, as predicted by the theoretical model.

Self-Cannibalizing for a Parkinson’s Disease Cure

Parkinson’s Disease (PD), characterized by impaired speech and motor skills, is likely caused by the accumulation of the protein α-synuclein, leading to cell death in the substantia nigra. A naturally occurring cellular process, autophagy (“self-eating”), is a possible therapeutic way to break down damaged or excess cellular materials. Whether it is used to degrade accumulated α-synuclein is unknown. To test the hypothesis that autophagy protects cells from the harmful effects of α-synuclein accumulation, we tested genetically compromised autophagy in cells producing α-synuclein. We analyzed cellular toxicity and α-synuclein accumulation and will report our findings on the autophagy and PD connection.

Insight Into Parkinson’s: Autophagy to the Rescue?

Parkinson’s disease is an incurable neurodegenerative illness that affects millions. Unfortunately, how the culprit protein α-synuclein contributes to cell death is still unknown. Autophagy is the process by which the cell degrades its own components through the lysosome. This process is regulated through three steps (nucleation, expansion, and fusion), each controlled by specific genes. In order to determine whether autophagy plays a role in the degradation of the protein α-synuclein, we assessed yeast strains deleted for the major autophagy genes. Results obtained thus far support that autophagy does subtly regulate α-synuclein localization, accumulation, and toxicity.

The Unipolar World
This panel presents the research of senior international relations and politics majors on the meaning and significance of American primacy on world politics in the 21st century. On a diverse range of topics, students pose and test hypotheses derived from a core set of questions: How does politics in a unipolar world work? How have U.S. foreign policies been shaped by the uneven distribution of power in the international system? Can unipolarity be extended beyond its “normal” lifecycle, and if so, how? If not, why? How have the world’s other great powers and emerging powers responded to unipolarity? Among others, topics include China and global finance, Japanese identity and East Asian security, and U.S. strategy under Obama.

Searching for New Genes that Control the Accumulation and Toxicity of Parkinson’s Disease Protein α-Synuclein
Parkinson’s disease (PD) is a neurodegenerative disease caused by accumulation of α-synuclein in dying midbrain neurons. Using a yeast model, we examined whether the two genes UBP3 and HRD1 that normally regulate protein accumulation would regulate α-synuclein accumulation and aggregation and overall cellular toxicity. We report two preliminary findings. First, the lack of HRD1 did not induce toxicity, but it did alter localization of α-synuclein. Secondly, the absence of UBP3 produced an unexpected morphological defect in α-synuclein expressing cells and causes mild toxicity. Our study suggests that both genes subtly regulate α-synuclein properties linked to PD pathogenesis and we recommend further analysis.

X-periments in Sound and Music

Students in Art 343: Video Art will make digital videos in response to digital music compositions provided by last semester's Music 325: Advanced Digital Music Composition class. The resulting videos will be screened for the Symposium audience, and artists will be available to discuss their work.

Faculty Sponsor: Eli Robb

Key Amino Acids that Contribute to Parkinson's Disease Protein Alpha-Synuclein's Pathotoxic Potential

Parkinson's disease is an incurable neurodegenerative disease affecting nearly 4 million people worldwide. The disease is linked to three properties of the protein α-synuclein: misfolding and aggregation, lipid interactions, and cellular toxicity. Scientists still do not fully understand how α-synuclein aggregates or binds lipids. Here, in a budding yeast model, we evaluate whether a key amino acid within the water fearing middle section of α-synuclein (alanine-76) and two specific amino acids that are often modified with phosphates (serine-87 and -129) influence these three α-synuclein properties. Our data suggests that all three amino-acids are contributors to alpha-synuclein's pathotoxic potential.

Role of Potassium, Chloride, and Taurine during Volume Regulation by Rainbow Trout Red Blood Cells

Regulatory volume decrease (RVD) is a compensatory response whereby swollen cells remove specific solutes, which is then followed by water, leading to volume recovery. The purpose of this study was to examine the role of potassium, chloride, and taurine in RVD by rainbow trout red blood cells (RBC). Our main hypothesis was that the efflux of both potassium and chloride is key to the RVD response and therefore blocking the transport of these ions would inhibit volume regulation. We also hypothesized that taurine would contribute to RVD. We found that blocking K+ or Cl- efflux inhibited RVD and increased osmotic fragility. In addition, inhibition of taurine efflux increased osmotic fragility. Our results were therefore consistent with our original hypotheses.

The Life of Benazir Bhutto

Benazir Bhutto was a powerful Pakistani politician, leader of the Pakistani People's Party. She was the first woman to be elected prime minister of Pakistan, but was removed from her position and exiled for alleged corruption. She was elected once more, but once again her title was revoked due to more scandalous accusations. Because she was never tried and found guilty, many believe the charges were founded on the basis of her gender. This is an overview of her life and influence over Pakistani politics as well as her tragic assassination.

Politics, Philosophy, and Social Policy

Presentations by two students who have dealt with the ethical and political dimensions of social policy issues: 1) Capital punishment: an analysis of common philosophical arguments for and against, the impact of its use in the United States, and how it can be reformed in the future. (Katherine Frost) 2) Tribal Sovereignty, A Two-Sided Coin: Tribal entities have an unusual status in American law: they are sovereigns. But is this sovereignty dependent--a political right limited by U.S.- or original--as tribes often maintain? And how can two such different sorts of sovereignty coexist within a single political system? (Maria Crane)

Students to Teachers: The Ultimate Fieldtrip

Teachers who make a difference in the lives of their students work diligently and passionately to polish their craft throughout their careers. These Lake Forest College students are beginning their journey as teachers in a semester-long internship in Waukegan Public Schools. In this session, they share stories about the joys and challenges they are facing as they learn what it takes to make a difference in the lives of their students and experience the difference in their own lives, too.

Ubuntu

We present a poster collage highlighting our study abroad experience in Gaborone, Botswana. The Southern African community in which we immersed ourselves has a world called Ubuntu. The essence of what it is to be human, Ubuntu means being connected with others in such a way that what one person does affects the whole of humanity. We portray our social encounters with people who embody the spirit of Ubuntu. Our collage is a mixture of our personal reflections from correspondence and journal entries as well as pictures and artifacts documenting our experience. Our time spent in Southern Africa heightened our global awareness and we want to share it with the College community.

Aikido Demonstration

In this presentation, we will demonstrate techniques used for self-defense from Aikido, a Japanese martial art that teaches how to create peaceful resolutions by redirecting an opponent’s energy to gain control of a situation. Through a series of joint locks, pins, and throws, as well as practice with jo (a four-foot staff) and bokken (a wooden, practice sword), students learn to protect themselves, and they also learn the peaceful philosophy behind the martial art. Morehei Ueshiba once said, “To control aggression without inflicting injury is the art of peace.” This is the philosophy we learn at the LFC Aikido Club.

Flames, Fumes, and Flashes: Students Fired Up About Chemistry

The members of the Lake Forest College Student Affiliates of the American Chemical Society (SAACS) have been nationally recognized as an award-winning chapter because of their continuing commitment and involvement in the community. SAACS will demonstrate central chemical principles through a series of attention-grabbing experiments, including freezing roses with liquid nitrogen, explosive hydrogen balloons, and a colorful ammonia fountain. Those in attendance will also be invited to join in a hands-on demonstration to make their very own “slime.”

Collaborative Recall of Social Information

Three experiments explore the influence of social information on collaborative memory performance. Experiment 1 uses passages by Mesoudi et al. (2006) and shows that collaborative inhibition is eliminated when participants are asked to recall social information. However, near ceiling performance and confounds in the passages render the results inconclusive. Experiment 2 addresses these problems while manipulating gossip and sociability. Results show collaborative inhibition across all conditions. There is a significant effect of gossip (gossip > non) and an effect of sociability (explicit > implicit). Experiment 3 separately manipulates gossip and interest in collaborative recall. Early results suggest that, while both interest and gossip enhance memory, interest yields stronger mnemonic benefits. Further, some degree of collaborative inhibition appears present in all manipulations.

Philosophy and International Affairs
We will give presentations by three students who have examined ethical and philosophical issues in international affairs. Topics include: 1) Ethical dilemmas and implications of foreign loans in third world countries: The question of whether or not these loans are effective and ethical will be investigated through the fields of realism, liberal constructivism, and idealism. (David Ristau) 2) Is the North Atlantic Free Trade Agreement actually a free trade agreement? Does NAFTA include protections, tariffs, and subsidies that undermine the goals that free trade is supposed to achieve? (Jordan Heathfield) 3) An analysis of the Darfur situation through the visions of utilitarianism and human rights ethics. Does the international community have an obligation to intervene? If so, to what extent? (Robert Erickson)

Evolutionary Economics: An Overview
Evolutionary economics is an emerging discipline, borrowing concepts from both economics and evolutionary biology. The goal of the field is to explain economic and business related phenomena using analysis of strategies and behaviors from the field of evolution. For evolutionary economics to become truly effective, many foundational ideas need to be resolved. This study examines competitive strategy in the automobile industry. First parsimony and phenetic clustering of automobile companies will be conducted. Then competition models will be run between clades on the phylogeny generated from both economic and evolutionary studies. The results of the models will be analyzed for similarities between economics and evolutionary biology, and also to see what type of business strategy best serves an automobile company.

Moliere's Tartuffe: From Paris to Lake Forest College
This will be a presentation of the process that students experienced during the fall-winter production of “Tartuffe,” as well as some history behind the play. We will be integrating a spoken presentation, video clips of some rehearsals, and a short scene from the production itself. We hope to show a few different aspects of the development of the production: first and foremost, we want to explore how the rehearsal and performance process of a classical piece differs from a contemporary piece, the discoveries the actors made during these processes, and the improvisational aspect of doing a comedic play; secondly, the designer meetings and the various artistic choices that accompany the time period in which “Tartuffe” is set; lastly, the actors’ audition process and working with an acclaimed Moliere expert. We will also be displaying the progress of the set, the costumes, the music, and other elements that added to the experience.

Theater of the Absurd
Our project will focus on one of the less understood forms of theater, Theater of the Absurd. Using dramaturgical information gathered from our original project, we hope to revise and polish the last scene of “Who’s Afraid of Virginia Woolf?” by Edward Albee. Our main goal will be to teach the principles of this type of theater, and highlight how unique it really is. This performance will give us a chance to showcase the dedication and hard work we all put into last semester, as well as showcase the talent of both junior and senior theater majors. Using a mixture of performance and research, we hope to do the Theater of the Absurd justice.

Evolution of a Journal: Six Years in Business
Eukaryon is an undergraduate research journal at Lake Forest College that publishes the very best of life science scholarship conducted by Lake Forest students. The journal began in 2004 with a board of only a single member and 100% article acceptance. Since then, we have expanded to include over 25 undergraduate members, and our acceptance rate has decreased to 45%. This poster will chronicle the journal’s progress the past 5 years, as we have continued to improve upon our publication process. Specifically, this year, our two main goals included improving the articles written by the editorial board through implementation of a features board and updating the look of our website.

Perspectives on Place

What is the role of place in the human experience and how can theories of place help us understand what it means to live in Chicago, or on its margins? How is the past built into the present in architectural structures or neighborhoods? What is the role of nature in urban society? How do microspaces affect us, for instance in classrooms or in homes? This presentation illustrates our FIYS research on place, space and the human, drawing on our ethnographic observations and analyses of the ways in which we shape place and conversely how place shapes the human.

China’s Transitions in the Age of Globalization

China, a country that has recently experienced rapid economic development and social changes, presents many new ideas and innovations, challenging China’s traditions, but promising a brighter future. Last summer, under the direction of Professor Shiwei Chen, five students traveled to China to examine the country’s transitions, in order to achieve a better understanding of China’s impact on the global community. In particular, they visited Hangzhou, Xian and Beijing, where they investigated China’s industrial expansion, educational privatization, and the Chinese government’s handling of the H1N1 epidemic. With this accomplishment, they look forward to sharing their discoveries in the Student Symposium.

Healthy People 2010 Movement

The new Lake Forest College Sports Center is in the process of being remodeled in order to encourage not only athletes but students, faculty, staff, and members of the community to take initiative to build a healthier environment. By expanding the health facilities and adding state-of-the-art equipment, the whole Lake Forest community will have the opportunity to start living healthier lives and participate in the Healthy People 2010 Movement. This movement, promoted by the U.S. Department of Health & Human Services, is a systematic approach for health improvement that focuses on increasing the quantity and quality of healthy years by eliminating health disparities. We will demonstrate how the Lake Forest community can achieve healthier lifestyles with the help of the Healthy People 2010 Movement and the new facilities on campus. Together we will increase awareness and healthy living habits of the entire Lake Forest community.

Female Preference for Novel Males in Guppies Poecilia Reticulata: Does a Fresh Face Matter?

Guppy sexual selection is determined by female choice. Male guppies display many different color morphs in a single population; a phenomenon called genetically based color polymorphism. We hypothesized that a female guppy is less responsive to a male with a similar morph to the one that has most recently courted her and more responsive to a male with a different morph. We observed that the females were more responsive to such different morph males on the first day females were introduced to a group of males. However, on the second day there was no significant difference between the female’s responses.

Madres Fuertes: Developing a Sustainable Future for Young Mothers

During the summer of 2009, we organized a development project called “Madres Fuertes” in Lima, Peru. The foremost goal of Madres Fuertes was to promote peace by helping young mothers to become independent and proactive members of their society, and by educating others about the repressed situation of women in the Peruvian society. Through sewing lessons and several workshops, the project provided young mothers with tools to improve their job skills, self-esteem levels, and knowledge of issues like sexuality, women’s rights, and motherhood. In our presentation, we will first give a brief overview of the situation of women in Peru and, then, use pictures, videos, and personal anecdotes to present the outcomes of Madres Fuertes.

Microfinance Activities for Economic Development
Small loans (usually less than $50) can provide opportunities for the development of business enterprises in the emerging economies. As governments are rethinking foreign aid programs, other alternatives are surfacing to enhance quality of life and to stimulate long-term economic development. Microfinance activities provide loans, savings accounts, insurance, and other financial services to billions of people living on $2 or less a day. Microloans are offered by institutions ranging from small community-based lending groups to international development organizations operating in over 100 countries.

Lake Forest College Voting Web Application
In the 2009 Computer Science Senior Seminar, our class of eight students created a database driven Web application for use by the school so faculty elections could be administered online. We utilized the LAMP (Linux, Apache, MySQL, PHP) open source environment on the server-side and HTML, CSS, and JavaScript on the front-end. The system allows for Web based voting on faculty elections, as well as the creation and monitoring of elections from the administrator side. The flexibility of the software allows for easy adaptation for other uses, such as student based elections. Moreover, the framework is sufficiently robust to serve as the basis for future Web application development.

American Girl and Children's Media
American Girl offers a rich example of children's media and consumption directed at girls. The retail store creates an environment in which girls perform as girls but also as consumers in training because in order to fit in with this culture, you must purchase objects. In this study we will focus on how young girls find their identity within this store through purchasing and how they interact with their families when it comes to purchasing decisions. By taking the role of ethnographers, we observe these girls interacting with their parents and their surroundings in order to support our theory about consumption and gender stereotypes among girls. We will also use pictures from our observations to help support our argument.

Effects of Vision on Auditory Threshold
It is widely believed that people with impairments in one sense (e.g., vision) develop heightened sensitivity in other senses (e.g., hearing). Does blocking input to one sensory system enhance performance in another one? To find out, we measured 27 students’ absolute thresholds for pitch and loudness, with their eyes closed vs. their eyes open. Contrary to our hypothesis, we found no statistically significant difference in mean threshold between the eyes-open and eyes-closed conditions. However, those who performed well in the loudness experiment were more likely to perform well in the pitch experiment, but only in the eyes-closed condition.
